

STOR Market Information Report: Tender Round 17

(Short-Term Operating Reserve)

Introduction

This market report is produced after each tender round and is designed to give existing and potential STOR participants an overall view of the tenders received in tender round 17 (TR17). The report provides details of tendered utilisation and availability prices and National Grid's consequent forward contracted position; together with further details on the type and dynamics of the tendered plant. For further information regarding this product or how and when to tender please consult the tender and reports section found on the National Grid Balancing Services information website:

http://www.nationalgrid.com/uk/Electricity/Balancing/services/STOR/

Furthermore, information on the use of the STOR service can be seen at monthly resolution in the Monthly Balancing Services Statement or annually in the Procurement Guidelines Report, found on the National Grid Balancing Services information website:

http://www.nationalgrid.com/uk/Electricity/Balancing/Summary/http://www.nationalgrid.com/uk/Electricity/Balancing/transmissionlicencestatements/PG/

In assessing the benefit of a STOR tender, the value and costs of that tender are considered. The forecast cost of an accepted tender will reflect expected availability costs and utilisation costs which incorporate the Minimum Non Zero Time (MNZT) of the unit and Minimum Utilisation Period (MUP) for non-BM providers. The tender assessment further considers the response time, the location and the reliability of the tendered unit. The latest assessment principles can be found on the STOR section of the Balancing Services website:

http://www.nationalgrid.com/NR/rdonlyres/7B8CA1AB-4964-4965-B5A2-126C8C202A11/40677/STOR Assessment Principles.pdf

This report is divided into two sections:

- Section 1 provides a summary of tendered and accepted volumes and price information across STOR seasons in 2012/13 (Year 6) and 2013/14 (Year 7). The data is broken down by response time and flexible or committed service providers.
- Section 2 provides an overview of the total contracted position for each season in Years 6 and 7 from TR17 and previous tender rounds.

Disclaimer of liability

The information contained or referred to in this market report and all other information relating to Short Term Operating Reserve which is provided by National Grid at any time whether before or after the date of publication of this market report is provided in good faith. Although National Grid makes reasonable efforts to ensure the accuracy and integrity of such information, no warranty or representation or other obligation or commitment of any kind is given by National Grid, its employees or advisors as to the accuracy, completeness, timeliness or fitness for any purpose of any such information. Neither National Grid nor its employees or advisors shall be under any liability for any error nor misstatement contained in this market report and will not be liable for any loss caused as a result of the reader doing or not doing anything as a result of reading this market report or any part of it.

Section 1.1 Submitted and Accepted Volumes

As National Electricity Transmission System Operator (NETSO), National Grid maintains an Operating Reserve Requirement (ORR) from 4 hours ahead of time to real time, to take account of demand forecast errors, plant losses and market imbalance. The ORR is met by headroom on market synchronised machines, additional actions taken by National Grid via the Balancing Mechanism (BM) and contracted reserve products. STOR is a contracted reserve product and as such STOR tenders can make up a finite proportion of the ORR. The amount of contracted STOR required is determined by the size of the ORR which changes due to forecast market length, market provided headroom, volume of intermittent generation and demand forecast errors. The proportion of the ORR met by STOR is determined by considering the technical system requirements and also the forecast cost of alternatives versus the cost of the tendered STOR units.

The tenders are assessed in accordance with the STOR Assessment Principles¹, which, amongst other things, consider availability prices (£/MW/h), utilisation prices (£/MWh), response times and geographical location. The accepted tenders are selected such that the total costs of maintaining the ORR and operating the system are lower than without the selection of those tenders.

STOR Volumes Procured by National Grid

Throughout the STOR seasons National Grid aims to procure a minimum of 1800MW of STOR (subject to sufficient economics). The daily (and seasonal) optimal STOR MW level varies due to real time (and seasonal) pressures on the system, but National Grid has engaged in having ~2300MW of STOR, when available.

This level of available STOR (~2300MW) is what National Grid expects to manage on a daily basis. National Grid examines historic availability profiles from committed and flexible providers to help determine the amount of STOR MW to procure, such that the contracted STOR MW would yield ~2300MW to be available on a daily basis, where economics allow.

Tenders Received in TR17

At the close of TR17, National Grid received tenders from 34 companies, totalling 142 units, for STOR contracts in 2012/13 and 2013/14. This included one unit that had not tendered before from an existing provider and two new providers entered the market. These new sites represent a potential maximum 18MW of new capacity if they were all fully available at the same time.

This tender round was the final tender opportunity for seasons 6.3 and 6.4, 75 and 78 units were tendered for these seasons respectively. This represents a potential maximum 1714MW for season 6.3 and 1741MW for Season 6.4 in addition to the 2501MW and 2603MW already contracted for the respective seasons. Four units with a response time greater than 20 minutes tendered for seasons 6.3 and 6.4, the remaining tenders were for response times of 20 minutes or less.

A potential maximum of 2344MW was submitted for seasons in STOR Year 7 (2013/14) from 83 units. This included tenders from three companies with indexations on their submitted prices. The indexations are to adjust the availability price with respect to RPI change, and to adjust the utilisation prices with respect to fuel price (Gasoil price in this instance) or a combination of RPI and fuel indexes.

Growth in Tendered Volumes leading to a highly competitive Marketplace

As mentioned in the previous Market Information Report, there has been a growth in the volume of MW tendered for STOR during the last couple of years (see Figure 1). Yet, during the same period, the amount of contracted STOR actually used to maintain the ORR² has remained fairly consistent. Allowing for seasonal influences and any one-off events, the proportion of contracted STOR that will actually contribute to the ORR is also expected to remain consistent throughout STOR Years 6 and 7 (2012/13 & 2013/14).

¹ http://www.nationalgrid.com/NR/rdonlyres/7B8CA1AB-4964-4965-B5A2-

¹²⁶C8C202A11/40677/STOR Assessment Principles.pdf

² Ignoring the impact from one-off events that led to larger than usual volumes of unsynchronised contracted reserve being requested. Such volumes were procured by accepting greater than usual volumes of Flexible STOR MW via the week-ahead assessment

Successful Tenders in TR17 and Outlook for STOR Year 6 (2012/13)

For the seasons ahead in Year 6, the combined capacity of new tenders along with the STOR already procured in previous tender rounds would result in having a level of STOR availability that is greatly in excess of the ORR. Those tenders accepted in TR17 were those that demonstrated the most beneficial price combination and providing sufficient MW to fulfil the optimal level of STOR, coincidentally the majority of these units were all for the Committed service.

The leading, and thus successful, tenders from this tender round have put competitive pressure amongst the existing Flexible STOR contracts for the four seasons remaining in STOR Year 6 as it is expected to see greater volumes of Committed STOR contributing to the optimal STOR MW level. National Grid's forecast for STOR availability means we do not expect high levels of week ahead flexible STOR availability rejections to occur in seasons 6.3 and 6.4, however there does exist the potential for the outcome of TR18 to result in further undercutting of existing flexible contracts which could possibly lead to week ahead rejections for such contracts during seasons 6.5 and 6.6.

Unlike the previous tender round, the location of a tender has not been a factor in rejecting tenders³. This is due to volumes of STOR MW meeting the locational MW requirements for the seasons ahead being procured in previous tender rounds.

The unsuccessful tenders in this tender round have been rejected on grounds of weaker economics, yet for a minority of unsuccessful tenders which had the "all or nothing" status applied, the "all or nothing" status played a detrimental impact on the economics of the tender. The "all or nothing" status managed to make the overall economics of such tenders weaker, yet for a very small proportion of these tenders, if the tender was assessed without that status, the tender would have been successful in achieving a STOR contract for part of the tendered duration.

Outlook for STOR Year 7 (2013/14)

Looking ahead to STOR Year 7 (2013/14), the strong economics⁴ of the tenders received has meant being able to procure larger volumes of STOR, than what has historically been the case at this point in the STOR tender timetable, for STOR service four seasons ahead.

It is expected that there will be minimal change to the level of available STOR that National Grid expects to use daily in Year 7 (~2300MW) and with ~1400MW of STOR already contracted for Year 7, the challenge of securing a STOR contract for Year 7 is greater than it has been historically at this point in the STOR tender cycle.

Apart from Scottish based tenders which have a devaluation applied to the economics of their tenders

⁴ Based on National Grid's assessment of future margin costs

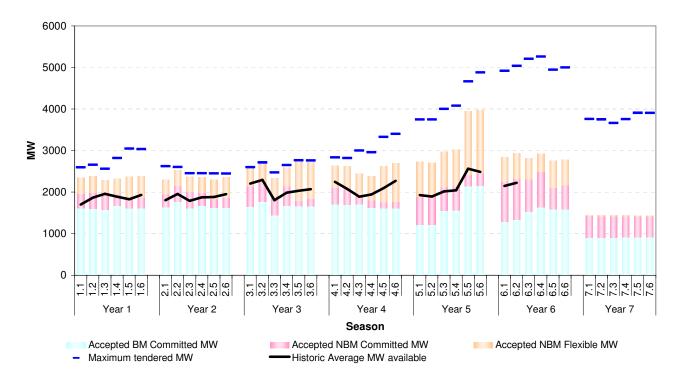

Figure 1 gives a breakdown of the accepted flexible and committed MW per season since the start of the STOR service. The blue line represents the sum of the maximum tendered MW from unique units from any tender round for each season. For seasons with tender rounds still to come, this figure will increase if units that thus far have not tendered for that season, tender in. The black line on the chart represents the outturn average availability for each season (where available).

Please note this chart contains data from previous tender rounds up to and including TR 17.

Figure 1

Breakdown of Accepted Flexible and Committed MW per season

Tables 1 and 2 show the total number of MW rejected or accepted together with their respective volume weighted availability and utilisation prices for Year 6 and Year 7. The table is split into Flexible or Committed units with response time less than or equal to 20 minutes, and units (flexible or committed) with response time greater than 20 minutes.

Please note these tables contain data from previous tender rounds up to and including TR 17.

Figure 2 presents the number of units and the total MW tendered and accepted, averaged either for each pair of seasons or for all six seasons in the case of year seven, with respect to the location in Great Britain. For instance, in the north of England region for seasons 6.5 & 6.6, an average of 24 units were tendered offering an average total of 453MW of capacity, of which 5 units were accepted which represents 53MW of capacity. The blue dots on the map indicate the location of the tenders (not including sites located in more than one region).

Figure 2 Map of Great Britain

MULTIPLE LOCATIONS (Aggregators)

6.3 & 6.4 (Ave.) Tendered: 5 Units, 111 MW

Accepted: 0 Units, 0 MW

6.5 & 6.6 (Ave.) Tendered: 6 Units, 27 MW

Accepted: 2 Units, 10 MW

7.1 - 7.6 (Ave.) Tendered: 25 Units, 178 MW

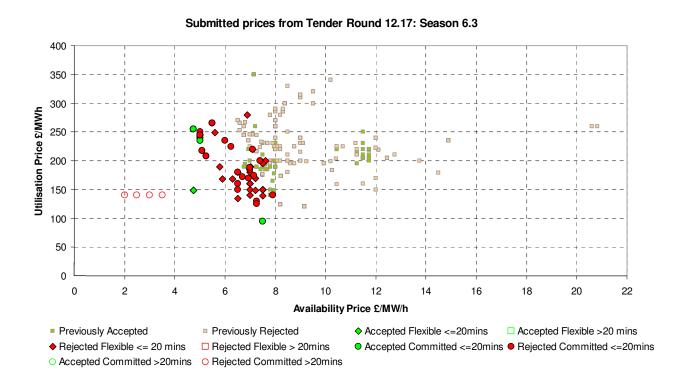

Accepted: 0 Units, 0 MW

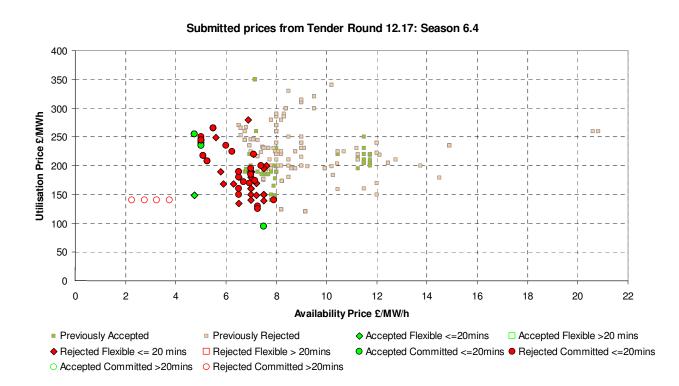

Section 1.2 Prices

Figures 3 and 4 below show scatter plots of availability and utilisation price for each tender and for each season. The data is broken down into response time groups of >20 mins or <=20 mins, flexible or committed service and accepted or rejected tenders. These charts also depict the accepted and rejected tenders from previous tender rounds.

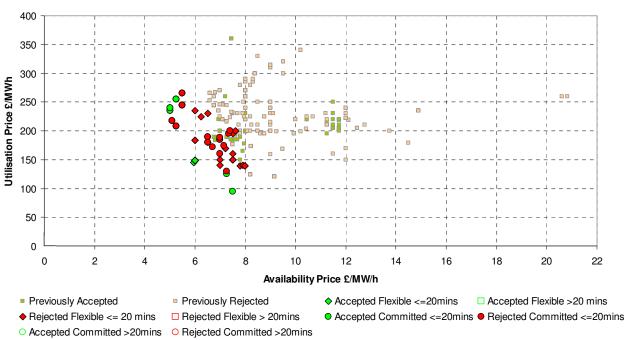

Figure 3 Year 6 Availability and Utilisation price charts

Submitted prices from Tender Round 12.17: Season 6.6

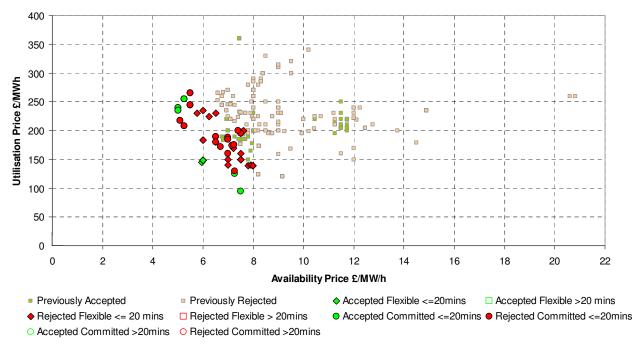

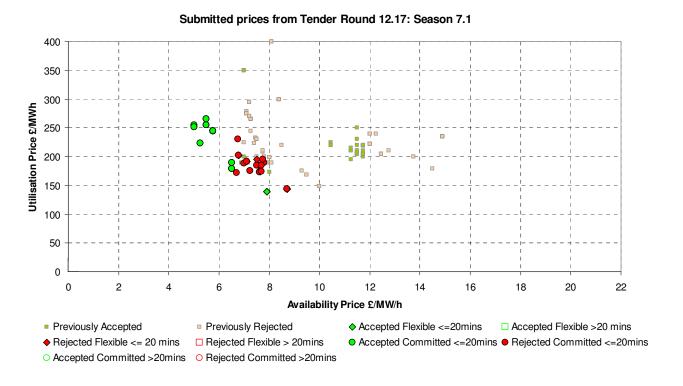

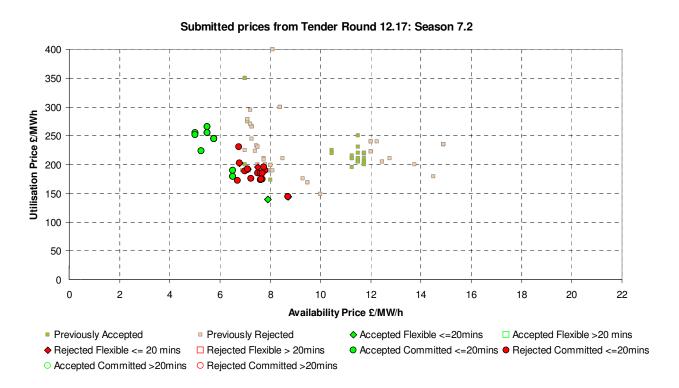

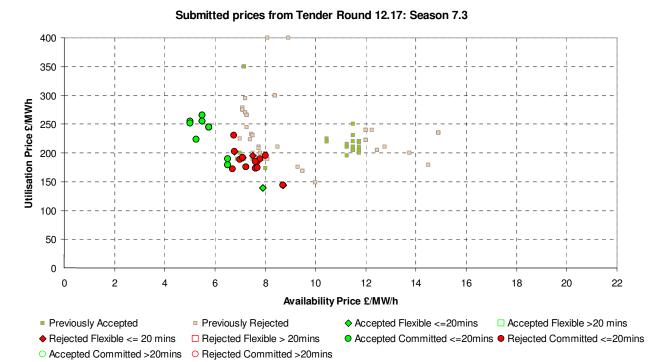

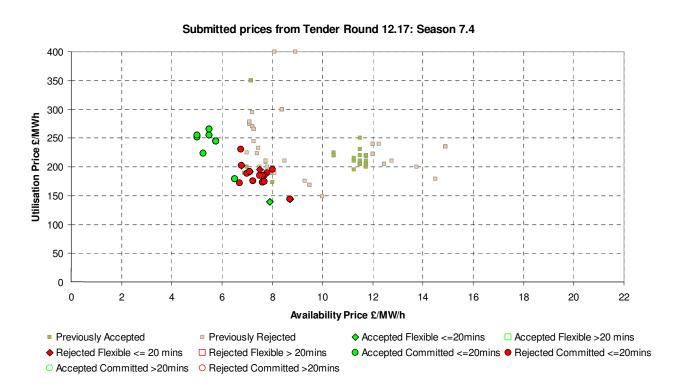

Figure 4 Year 7 Availability and Utilisation price charts

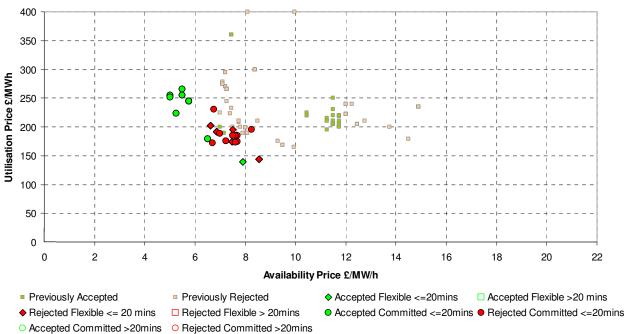

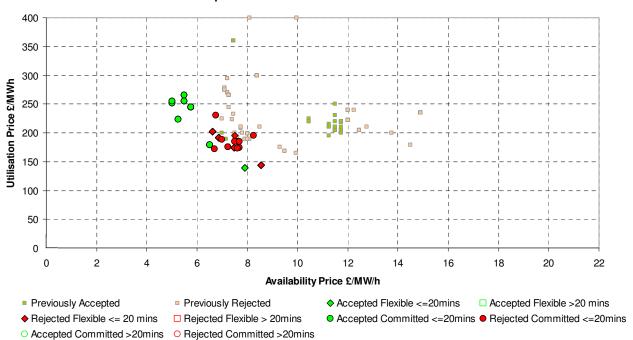

Submitted prices from Tender Round 12.17: Season 7.6

Section 1.3 MW Capacity

Figures 5 and 6 exhibit cumulative graphs. In these graphs the total accepted MW from previous tender rounds, up to and including the results from TR 17, have been stacked according to two categories: Figures 5a and 6a illustrate the accepted MW stacked in terms of the utilisation price of a unit and Figures 5b and 6b illustrate the accepted MW stacked according to the response time of the unit, both sets of data are arranged in ascending order. Figure 5a shows that for season 6.3 there is approximately 1500MW of contracted STOR with utilisation prices of £200/MWh or less. For the first time, the utilisation prices have had indexation applied (seasonal and annual) for Year 6 only as Year 7 indexes are not currently known. Please note that the charts in Section 1.3 include MW from flexible units, which may not be available at all times. Also note that the charts contain data from previous tender rounds up to and including TR 17.

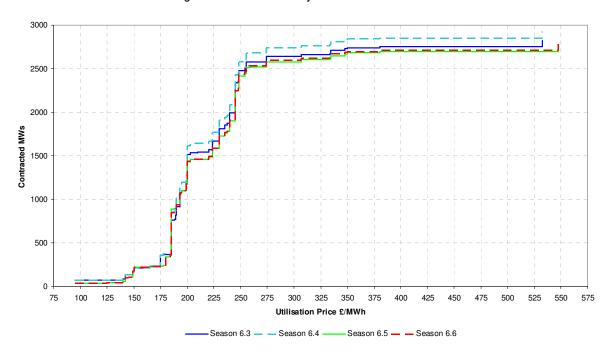

Figure 5a: Cumulative MW by Utilisation Price for Year 6

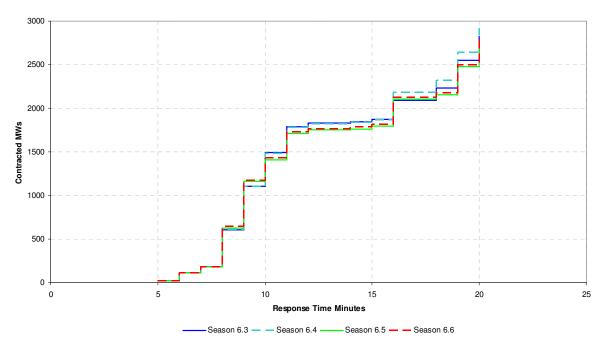

Figure 6b illustrates that for seasons 7.5 and 7.6 approximately 1200MW of STOR is contracted with a response time of 10 minutes or less. **No indexation has been applied to Year 7 utilisation prices, the utilisation prices are presented according to their original base year.**

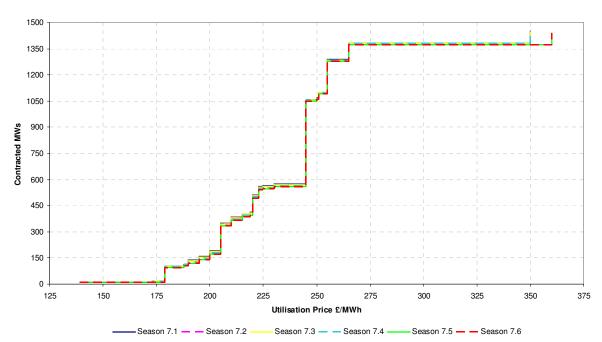

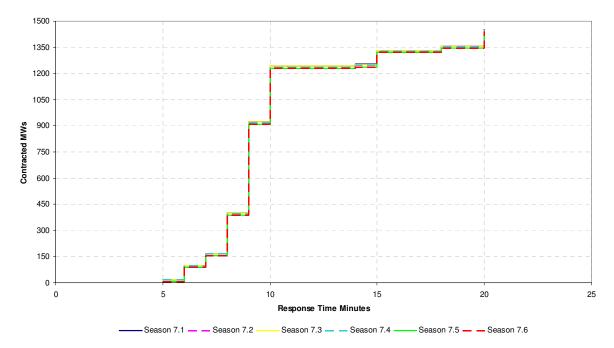

Figure 6a: Cumulative MW by Utilisation Price for Year 7

Section 2 **Total Contracted Position**

Figure 7 shows the breakdown of accepted volumes by committed and flexible services across the seasons of Years 6 and 7. The table accompanying Figure 7 below displays the same data in table format.

Figure 7 Year 6 and 7 summaries by tender round

Please note this figure contains data from previous tender rounds up to and including TR 17.

Appendix 1: Terminology and Definitions

High level description of STOR:

STOR is designed to give National Grid sufficient Operating Reserve to replace sudden generation losses, or unpredictable changes in demand between four hours ahead of real time and real time and requires a large proportion of units to be available within 20 minutes. STOR also recognises that other potential reserve providers who cannot meet the 20 minute response time criteria can still be of value in meeting our reserve requirement. Hence a key aspect of the definition of the STOR product is that it extends the maximum response time to 240 minutes to allow alternative providers to participate. How value is placed on these units by National Grid is different to the sub 20 minute notice units as the longer notice units compete mainly with alternative options available in the Balancing Mechanism with equivalent response times. Location, reliability and utilisation parameters are also important elements of the STOR assessment.

The committed service applies to all providers who wish to make themselves available for all required windows nominated by National Grid. Both BM and NBM providers can tender for this service. The flexible service applies only to NBM providers and allows the provider to make the unit available or unavailable for particular windows. This availability is assessed on a week-ahead basis and providers are notified if their service is required or not. It is at the discretion of National Grid whether a unit is accepted or rejected at the week-ahead stage and this decision will be based on the same assessment principles as the main tender assessment. The increased accuracy of the week-ahead forecast means that some factors may have more importance such as location if specific constraint issues are forecast. Both Services attract an availability payment paid on a £/MW/h basis when available within defined windows and an utilisation payment on delivery of STOR MW when instructed by National Grid paid on a £/MWh basis.

A summary of the STOR service can be found on our website at the following link:

http://www.nationalgrid.com/NR/rdonlyres/72D4386B-2027-474C-B281-2384F5B21A5E/40978/TR11STORGeneralDescriptionFinal.pdf

Appendix 2:

Accepted and Rejected Tenders TR 17: A list of information containing prices, response time, location and unit type of all accepted and rejected tenders from this tender round, previously found in the appendix to the market information reports, can now be downloaded, in spreadsheet format, from the tender and reports section of the National Grid Balancing Services webpage:

http://www.nationalgrid.com/uk/Electricity/Balancing/services/STOR/

Appendix 3: Season Reference

The following tables summarise the season information for the current year (Year 6) and the following year (Year 7).
