

STOR Market Information Report: Tender Round 21

(Short-Term Operating Reserve)

Introduction

This market report is produced after each tender round and is designed to give existing and potential STOR participants an overall view of the tenders received in tender round 21 (TR21). The report provides details of tendered utilisation and availability prices and National Grid's consequent forward contracted position; together with further details on the type and dynamics of the tendered plant. For further information regarding this product, frequently asked questions, or how and when to tender please consult the tender and reports section found on the National Grid Balancing Services information website:

http://www.nationalgrid.com/uk/Electricity/Balancing/services/STOR/

Furthermore, information on the use of the STOR service can be seen at monthly resolution in the Monthly Balancing Services Statement or annually in the Procurement Guidelines Report, found on the National Grid Balancing Services information website:

http://www.nationalgrid.com/uk/Electricity/Balancing/Summary/

http://www.nationalgrid.com/uk/Electricity/Balancing/transmissionlicencestatements/PG/

In assessing the benefit of a STOR tender, the value and costs of that tender are considered. The forecast cost of an accepted tender will reflect expected availability costs and utilisation costs which incorporate the Minimum Non Zero Time (MNZT) of the unit and Minimum Utilisation Period (MUP) for non-BM providers. The tender assessment further considers the response time, the location and the reliability of the tendered unit. The latest assessment principles can be found on the STOR section of the Balancing Services website:

http://www.nationalgrid.com/NR/rdonlyres/7B8CA1AB-4964-4965-B5A2-126C8C202A11/40677/STOR Assessment Principles.pdf

This report is divided into two sections:

- Section 1 provides a summary of tendered and accepted volumes and price information across STOR seasons in 2013/14 (Year 7) and 2014/15 (Year 8). The data is broken down by response time and flexible or committed service providers.
- Section 2 provides an overview of the total contracted position for each season in Years 7 and 8 from TR21 and previous tender rounds.

Disclaimer of liability

The information contained or referred to in this market report and all other information relating to Short Term Operating Reserve which is provided by National Grid at any time whether before or after the date of publication of this market report is provided in good faith. Although National Grid makes reasonable efforts to ensure the accuracy and integrity of such information, no warranty or representation or other obligation or commitment of any kind is given by National Grid, its employees or advisors as to the accuracy, completeness, timeliness or fitness for any purpose of any such information. Neither National Grid nor its employees or advisors shall be under any liability for any error nor misstatement contained in this market report and will not be liable for any loss caused as a result of the reader doing or not doing anything as a result of reading this market report or any part of it.

Section 1.1 Submitted and Accepted Volumes

As National Electricity Transmission System Operator (NETSO), National Grid maintains an Operating Reserve Requirement (ORR) from 4 hours ahead of time to real time, to take account of demand forecast errors, plant losses and market imbalance. The ORR is met by headroom on market synchronised machines, additional actions taken by National Grid via the Balancing Mechanism (BM) and contracted reserve products. STOR is a contracted reserve product and as such STOR tenders can make up a finite proportion of the ORR. The amount of contracted STOR required is determined by the size of the ORR which changes due to forecast market length, market provided headroom, volume of intermittent generation and demand forecast errors. The proportion of the ORR met by STOR is determined by considering the technical system requirements and also the forecast cost of alternatives versus the cost of the tendered STOR units.

The tenders are assessed in accordance with the STOR Assessment Principles¹, which, amongst other things, consider availability prices (£/MW/h), utilisation prices (£/MWh), response times and geographical location. The accepted tenders are selected such that the total costs of maintaining the ORR and operating the system are lower than without the selection of those tenders.

STOR Volumes Procured by National Grid

National Grid aims to procure STOR tenders such that a minimum of 1800MW of contracted STOR is made available throughout the STOR seasons (subject to sufficient economics). The daily and seasonal optimal STOR MW level varies due to real time and seasonal pressures on the system, but National Grid typically engages in having approximately 2300MW of STOR when available. The optimal STOR volumes (2300MW) can include STOR units with a long notice response time (has response time greater than 20 minutes), where economics are sufficient. A unit's tendered response time and price are, and will remain, key factors in the assessment of STOR tenders.

The optimal STOR MW level is what National Grid expects to manage on a daily basis, over and above the minimum of 1800MW. National Grid examines historic availability profiles from committed and flexible providers to help determine the amount of STOR MW to procure, such that the contracted STOR MW would yield the optimal STOR MW to be available on a daily basis, allowing for economics and pressures on the system.

Tenders Received in TR21

On Market Day for TR21 (30th August 2013), National Grid received tenders from 40 companies, totalling 163 units, for STOR contracts in 2013/14 and 2014/15. This included 13 units that had not tendered before from existing providers and four new providers entered the market with 7 units. These new tendered sites, from the four new providers, represent a potential maximum 39MW of new capacity if they were all fully available at the same time.

This tender round was the final tender opportunity for seasons 7.5 and 7.6, 100 and 104 units were tendered for these seasons respectively. This represents a potential maximum 1234MW for season 7.5 and 1261MW for Season 7.6 in addition to the 2727MW and 2721MW already contracted for the respective seasons. Four units with a response time greater than 20 minutes tendered for seasons 7.5 and 7.6, the remaining tenders were for response times of 20 minutes or less.

A potential maximum of 1768MW was submitted for seasons in STOR Year 8 (2014/15) from 99 units. This included tenders from one company with indexations on their submitted prices. The indexations are to adjust the availability price with respect to Retail Prices Index change, and to adjust the utilisation prices with respect to the reverse direction of the magnitude change to the Retail Prices Index.

The STOR Marketplace Continues to be Competitive and Heavily Subscribed

The growth in the maximum volume of MW tendered for STOR for the immediate seasons ahead has stabilised, following the highs for seasons 7.3 and 7.4. Yet, the STOR marketplace continues to attract new entrants and be competitive.

http://www.nationalgrid.com/NR/rdonlyres/7B8CA1AB-4964-4965-B5A2-126C8C202A11/40677/STOR Assessment Principles.pdf

The amount of contracted STOR used to maintain the ORR² continues to be consistent. Allowing for seasonal influences and any one-off events, the proportion of contracted STOR that will actually contribute to the ORR is expected to drop slightly following season 7.5 onwards to reflect that MW from any Long Notice STOR unit(s), if contracted, will contribute to the optimal STOR MW level.

Looking ahead to the next tender round (TR22), participants should give consideration to their tendering strategy going forward with regard to unit availability. It remains National Grid's preference that the optimal STOR MW level is made available for all daily STOR windows, this is particularly relevant over the winter periods.

Owing to the highly competitive nature of the STOR market, when tendering in for future tender rounds, it is highly recommended that STOR providers consider optimising their tendered technical parameters, where appropriate.

Optimising tendered technical parameters can be a benefit to participants, for instance, available STOR volumes can be dispatched in response time order, rather than in economic merit order.

Successful Tenders in TR21

For the remaining seasons in Year 7, the combined capacity of tenders in TR21 along with the STOR already procured in previous tender rounds would result in having a level of STOR availability that would be in excess of the ORR. Thus, the tenders that were accepted in TR21 were those that demonstrated the most cost-beneficial prices through their tendered availability prices, when compared to the cost of creating margin in the balancing mechanism and that the selected tenders would be able to provide sufficient MW to enable the optimal level of STOR to turn out throughout all the daily STOR windows.

The volume of rejections to flexible STOR units, that are made available, on a week to week basis will continue to be influenced by a number of factors such as wider contracted STOR unit availability and the market surplus at the week ahead stage. However, flexible units that are rejected at the week ahead stage may be utilised subject to economics and where still available via Standing Reserve Dispatch (SRD).

The Long Notice STOR tenders have contributed to the total accepted MW figure in this tender round, due to the strength of their economics.

The location of a tender and the response time of a unit have not been factors in rejecting tenders.

The unsuccessful Year 7 tenders in this tender round have been rejected on grounds of weaker economics and, for some tenders, an unfavourable threshold was placed on the amount of running hours that the tendered units can be utilised. Once the threshold on the running hours is met, there would be an amount of uncertainty associated with these tenders. Conditional restrictions placed on tenders are likely to have an impact on the economic assessment of a tender.

Following the earlier seasons in Year 7, Flexible STOR MW will be making up a larger proportion of contracted STOR volumes for the rest of the STOR year. This presents an opportunity for the flexible STOR participants to focus on optimising the availability of their units at the week ahead stage, especially through the winter season.

Outlook for STOR Year 8 (2014/15)

Looking ahead to STOR Year 8 (2014/15), the economics³ of the tenders received has resulted in the acceptance of a number of STOR tenders, yet there are sufficient volumes of STOR MW to be procured in the next tender round and also future tender rounds.

The unsuccessful Year 8 tenders in this tender round have been rejected on grounds of weaker economics, response time, and a threshold on unit running hours. A number of tenders were also rejected because they did not provide full unit availability for the whole year. To ensure that there is sufficient contracted MW to meet the

_

² Ignoring the impact from one-off events that led to larger than usual volumes of unsynchronised contracted reserve being requested. Such volumes were procured by accepting greater than usual volumes of flexible STOR MW via the week-ahead assessment

³ Based on National Grid's assessment of future margin costs

ORR during the STOR year ahead, National Grid appreciates tenders of a whole year in length to help plan and manage the procurement of STOR volumes at least three seasons ahead of real time service.

Future Tender Rounds Covering STOR Year 8 and Onwards

In current market conditions, the impact of the new Balancing Services Incentive Scheme⁴ could potentially result in National Grid accepting an increasing volume of tenders closer to real time at the last tender round opportunity. As a result, tenderers are advised to review their tendering strategy with regard to choosing the 'All or Nothing' condition.

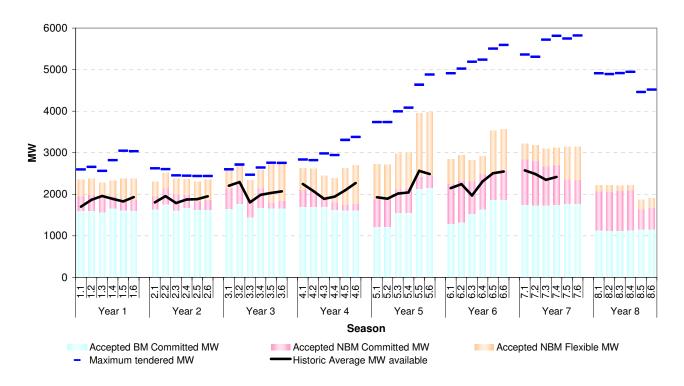

National Grid is also currently reviewing responses to the Outline Change Proposals Document (OCP-05) which included the potential concept of a "Premium" Flexible STOR Product. Whilst the specifics of the product are still being finalised National Grid expects to include it as an option within Tender Round 22 for both STOR Year 8 and 9. Further feedback on this product will be given in the Detailed Change Proposals Document (DCP-05) to be published on 22nd November 2013.

Figure 1 gives a breakdown of the accepted flexible and committed MW per season since the start of the STOR service. The blue line represents the sum of the maximum tendered MW from unique units from any tender round for each season. For seasons with tender rounds still to come, this figure will increase if units that thus far have not tendered for that season, tender in. The black line on the chart represents the outturn average availability for each season (where available).

Please note this chart contains data from previous tender rounds up to and including TR21.

Figure 1

Breakdown of Accepted Flexible and Committed MW per season

1

⁴ For more information, please refer to the Market Information Report covering TR20: http://www.nationalgrid.com/NR/rdonlyres/B24E2503-0F7D-4131-90B6-EF35314FBB72/61662/TR20_STOR_MIR.pdf

Tables 1 and 2 show the total number of MW rejected or accepted together with their respective volume weighted availability and utilisation prices for Year 7 and Year 8. The table is split into Flexible or Committed units with response time less than or equal to 20 minutes, and units (Flexible or Committed) with response time greater than 20 minutes.

Please note these tables contain data from previous tender rounds up to and including TR 21.

Figure 2 presents the number of units and the total MW tendered and accepted, averaged either for a pair of seasons or for all six seasons in the case of year seven, with respect to the location in Great Britain. For instance, in the south of England region for seasons 8.1 & 8.6, an average of 47 units were tendered offering an average total of 1014MW of capacity, of which an average of 15 units were accepted which represents an average total of 318MW of capacity. The orange dots on the map indicate the location of the tenders (not including sites located in more than one region).

Figure 2 Map of Great Britain

MULTIPLE LOCATIONS (Aggregators)

7.5 & 7.6 (Ave.) Tendered: 53 Units, 393 MW

Accepted: 11 Units, 76 MW

8.1 - 8.6 (Ave.) Tendered: 24 Units, 183 MW

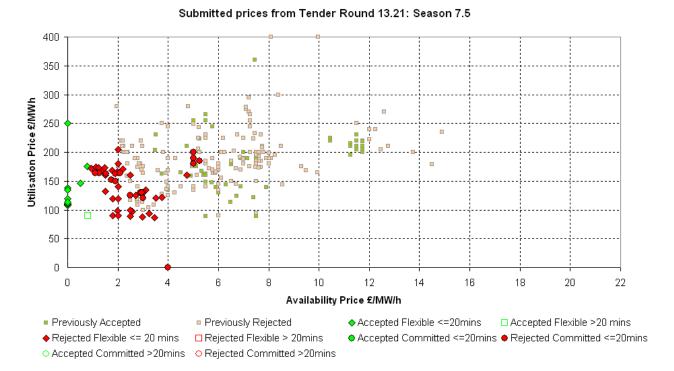

Accepted: 1 Unit, 5 MW

Section 1.2 Prices

Figures 3 and 4 below show scatter plots of availability and utilisation price for each tender and for each season. The data is broken down into response time groups of >20 mins or <=20 mins, flexible or committed service and accepted or rejected tenders. These charts also depict the accepted and rejected tenders from previous tender rounds.

Figure 3 Year 7 Availability and Utilisation price charts

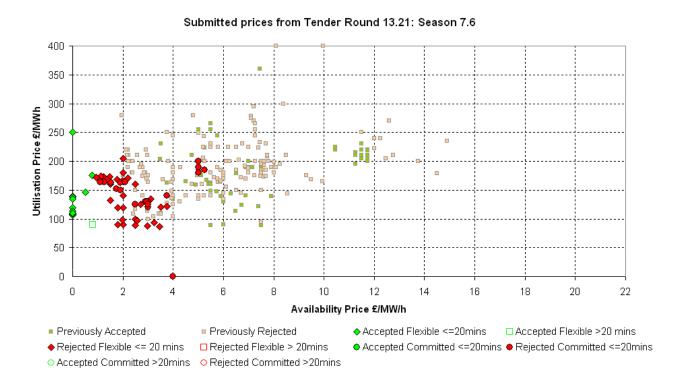

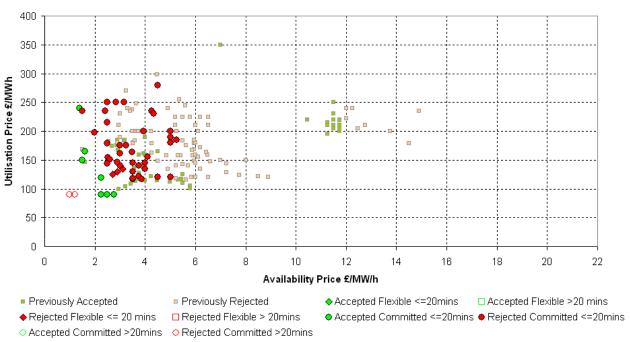

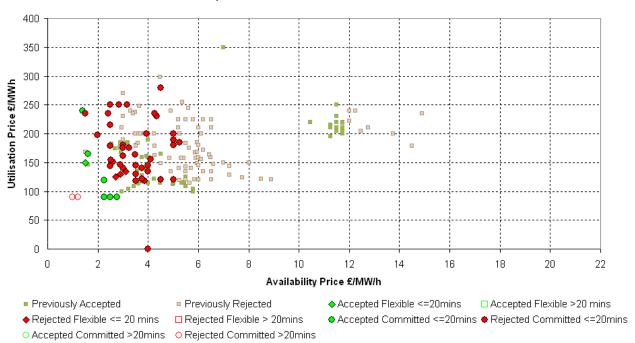

Figure 4 Year 8 Availability and Utilisation price charts

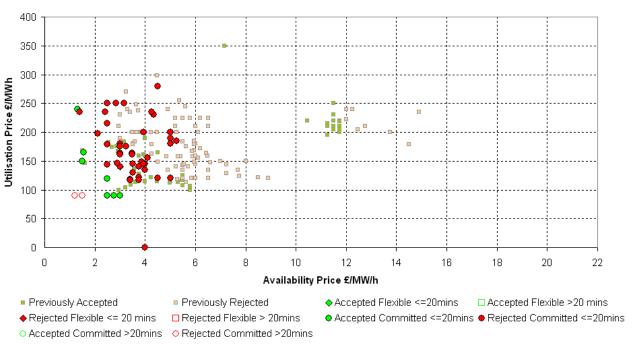

Submitted prices from Tender Round 13.21: Season 8.2

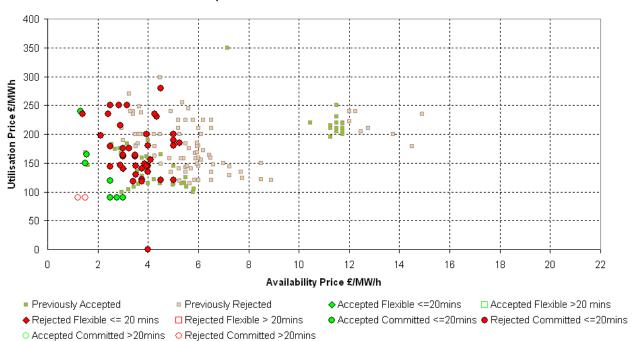

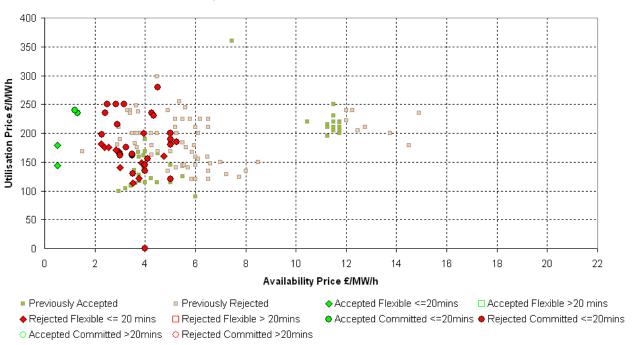

Submitted prices from Tender Round 13.21: Season 8.4

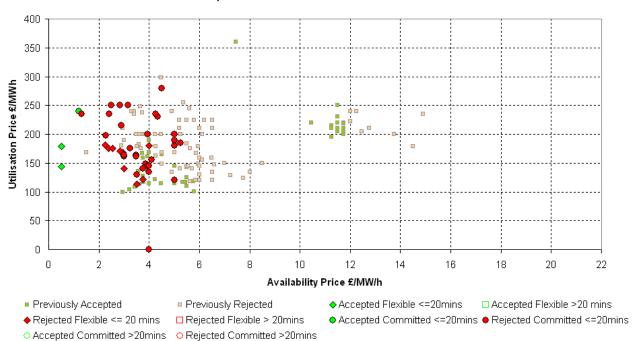

Submitted prices from Tender Round 13.21: Season 8.6

Section 1.3 MW Capacity

Figures 5 and 6 exhibit cumulative graphs. In these graphs the total accepted MW from previous tender rounds, up to and including the results from TR21, have been stacked according to two categories: Figures 5a and 6a illustrate the accepted MW stacked in terms of the utilisation price of a unit and Figures 5b and 6b illustrate the accepted MW stacked according to the response time of the unit, both sets of data are arranged in ascending order. Figure 5a shows that for season 7.5 there is approximately 1600MW of contracted STOR with utilisation prices of £200/MWh or less. The utilisation prices have had indexation applied (seasonal and annual) for Year 7 only as Year 8 indexes are not currently known. Please note that the charts in Section 1.3 include MW from flexible units, which may not be available at all times. Also note that the charts contain data from previous tender rounds up to and including TR21.

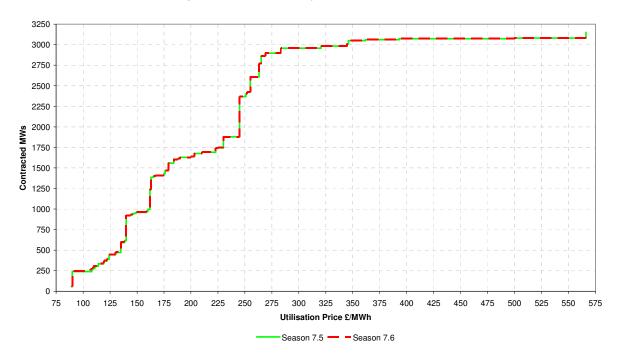

Figure 5a: Cumulative MW by Utilisation Price for Year 7

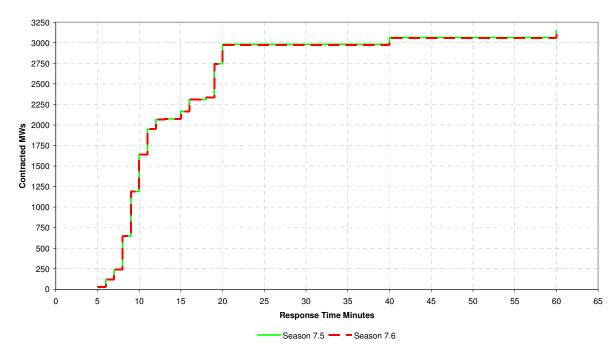

Figure 6b illustrates that for seasons 8.1 and 8.2 approximately 850MW of STOR is contracted with a response time of 10 minutes or less. No indexation has been applied to Year 8 utilisation prices, the utilisation prices are presented according to their original base year.

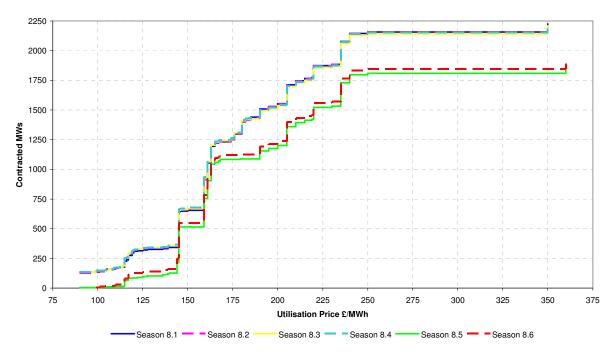

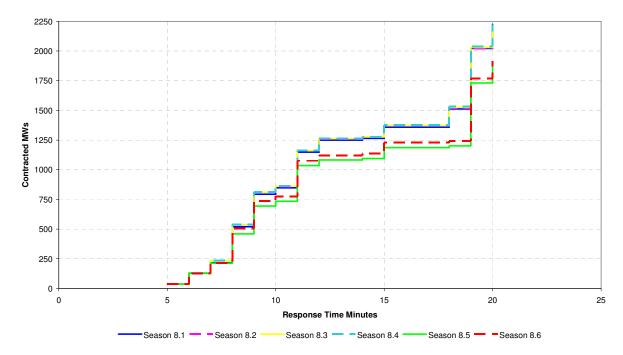

Figure 6a: Cumulative MW by Utilisation Price for Year 8

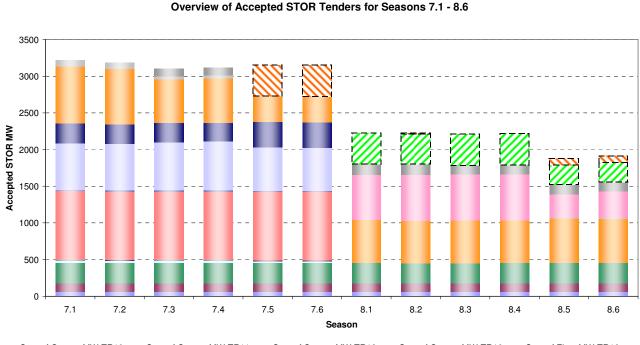

Section 2 Total Contracted Position

Figure 7 shows the breakdown of accepted volumes by committed and flexible services across the seasons of Years 6 and 7. The table accompanying Figure 7 below displays the same data in table format.

Figure 7 Year 7 and 8 summaries by tender round

Please note this figure contains data from previous tender rounds up to and including TR21.

Appendix 1: Terminology and Definitions

High level description of STOR:

STOR is designed to give National Grid sufficient Operating Reserve to replace sudden generation losses, or unpredictable changes in demand between four hours ahead of real time and real time and requires a large proportion of units to be available within 20 minutes. STOR also recognises that other potential reserve providers who cannot meet the 20 minute response time criteria can still be of value in meeting our reserve requirement. Hence a key aspect of the definition of the STOR product is that it extends the maximum response time to 240 minutes to allow alternative providers to participate. How value is placed on these units by National Grid is different to the sub 20 minute notice units as the longer notice units compete mainly with alternative options available in the Balancing Mechanism with equivalent response times. Location, reliability and utilisation parameters are also important elements of the STOR assessment.

The committed service applies to all providers who wish to make themselves available for all required windows nominated by National Grid. Both BM and NBM providers can tender for this service. The flexible service applies only to NBM providers and allows the provider to make the unit available or unavailable for particular windows. This availability is assessed on a week-ahead basis and providers are notified if their service is required or not. It is at the discretion of National Grid whether a unit is accepted or rejected at the week-ahead stage and this decision will be based on the same assessment principles as the main tender assessment. The increased accuracy of the week-ahead forecast means that some factors may have more importance such as location if specific constraint issues are forecast. Both Services attract an availability payment paid on a £/MW/h basis when available within defined windows and an utilisation payment on delivery of STOR MW when instructed by National Grid paid on a £/MWh basis.

A summary of the STOR service can be found on our website at the following link:

http://www.nationalgrid.com/NR/rdonlyres/083D0D9C-1A33-4336-8FA3-1A69DCC1C903/60303/TR20 General Description.pdf

Appendix 2:

Accepted and Rejected Tenders TR21: A list of information containing prices, response time, location and unit type of all accepted and rejected tenders from this tender round, previously found in the appendix to the market information reports, can now be downloaded, in spreadsheet format, from the tender and reports section of the National Grid Balancing Services webpage:

http://www.nationalgrid.com/uk/Electricity/Balancing/services/STOR/

Appendix 3: Season Reference
