GC0091 – Joint GCRP/DCRP Workgroup on GB Application of Demand Connection Code

Summary

The [GC0091 Workgroup](#) was raised under GCRP/DCRP governance to manage the national implementation process for the Demand Connection Code (DCC), one of the three European Connection Codes. This included understanding the structure of the code and formulating the corresponding GB code changes via a code mapping exercise.

The GB implementation work has progressed through this Issue group and proposals have been developed for implementing the technical requirements of DCC; however, in order to progress the GB code changes this Issue group is now being re-proposed as a Grid Code modification, GC0104, which will be raised at August Grid Code Panel. By following Open governance procedures GC0104 will benefit from a time table set out by the Code Administrator, a solution-focussed Workgroup with a defined defect, and will result in new legal text.

Proposed Solution

The Issue group GC0091 identified the Grid Code changes necessary in GC0104 for national implementation of DCC and should now be closed. However, the implementation work shall carry on under GC0104 and will continue to take a Distribution Code joint working approach.

Recommendation

Formally withdraw and close the GC0091 Grid Code issue workgroup.
